

BI was built for a box. Intelligence needs a network.

Traditional BI organizes information into containers. AINative connects information into a model of the real world.

THE LEGACY PARADIGM

BI was built for a box

- Tables
- Rows + Columns
- Dashboards
- Reports
- Schemas
- KPIs

THE SUBSTRATE

AINative Core

Core does not terminate inside another box. It resolves downward into a living semantic network of entities, relationships, context, actions, and meaning.

Boxes → Networks

Data → Context

RESOLVES

Entities, not rows

RETURNS

Meaning, not records

BI asks: “What is in the box?”

Information exists only because someone first decided which box, table, field, dashboard, or report it belongs inside.

Identifiers

Who or what something is.

Properties

What something is like.

Actions

What something does, did, or can do.

Relationships

How things are connected.

ONE CONTINUOUS SEMANTIC SYSTEM — NOT FOUR DATABASES

01
BI → Boxes

02
AI → Context

03
Ontology → Meaning

BI

“Put the data in the right box.”

AINATIVE

“Understand what everything means in relation to everything else.”
